

The Science of Better Data

www.mtna.us | mtna@mtna.us

Open Data, Safe Data

We're open data friendly and understand the need for greater data accessibility and transparency, but also recognize the importance of security and privacy. We can help open data of all sizes to the right user communities and deliver solutions hosted in public or private clouds, institutional infrastructures, or secure virtual data enclaves. In our mind, Open Data is also Safe Data.

Our Data Expertise

We have had the privilege of collaborating with government statistical agencies, international organizations, data archives, academic and research institutions, and researchers all around the world for over a decade. This has empowered our data scientists with a broad and unique expertise in all aspects of statistical and scientific data management. We are also globally recognized experts in metadata standards, in particular DDI and SDMX to which we have extensively contributed.

The Science of Better Data

Technology and data are in constant state of evolution. We can assist transform your data management infrastructure and practices through the use of state of the art technology, the adoption of best practices, and compliance with globally recognized standards. We also understand that such change require strategic planning and be introduced in a non-intrusive manner to minimize impact on ongoing business processes.

SledgeHammer.

<http://www.openmetadata.org/sledgehammer>

SledgeHammer is a powerful tool that facilitates the transformation of data across popular proprietary, text, and database formats, and enables the extraction and generation of standards based metadata. It runs equally on Microsoft, Mac or Linux platforms. It offers the following features:

- Reading data and extracting metadata from: Stata, SPSS, SAS, DDI+ASCII, and Stat/Transfer+ASCII
- Transforming data into ASCII text format (fixed, csv, delimited), with various optimizations
- Producing standard metadata from input files. Supported specifications include DDI-Codebook (1.0-2.1 and 2.5), DDI LifeCycle (3.1-3.2), and Triple-SSS (1.1, 2.0)
- Computing summary statistics at the variable and category levels for inclusion in DDI or for other purposes. Summary statistics include minimum, maximum, average, standard deviation, count of missing values, weighted and unweighted frequencies
- Generating scripts for reading ASCII data into R, SAS, SPSS, Stata, and various flavors of SQL (MS-SQL, MySQL, Oracle, Vertica, HSQLDB). The database scripts support the creation of database schemas along with bulk loading of the ASCII data.
