

The DASISH Questionnaire Design and Documentations Tool (QDDT)

The Questionnaire Design Documentation Tool (QDDT)

- A system for developing and documenting the full questionnaire development process of cross-national survey programmes, from the first concepts and questions to the final questionnaires,
- improving both quality and transparency
- Internal (producer) users can use the tool to document the question design process
- External (consumer) users can use it to understand how each item and concept was developed
- Once the design for a questionnaire module has been completed, the information can be made available for download and transfer
- The information is permanently stored in the database for future reuse and reference
- QDDT is planned as the 'mother tool' in a chain of interoperable tools for the survey lifecycle
- Interoperability with the QVDB and the TMT is a key aim

QDDT – current functionalities: develop a code list

QDDT – next step functionalities

- Add more response domains, for example text, numeric and scale
- Handling of complex question structures like batteries and grids
- Add comparison and mapping functionalities
- Control/Construct
- Develop web-services (REST API) for export to and import from the TMT and the QVDB, as well as other systems
- Add export formats in addition to DDI 3.2 XML format, for example: DDI-C and DDI RDF
- Add print functionality that will allow users to print enhanced reports
- Questionnaire delivery:
 - PAPI has first priority.
 - CAPI and Web-survey is a goal for the further steps
- Versioning:
 - Add versioning functionality to all versionable used DDI elements
 - Add Rationale/Code controlled vocabularies to versionable elements
 - This will be used to assign a version number at a specific level automatically
 - Automatic versioning of a Scheme when an included element is updated
- Publication:
 - Add UserAttributePair controlled vocabularies for publication status for modules and questions
 - This will be used to flag if a publication is internal (shared between partners) or external (made publicly available).
 - as well as to document the business purpose for the published version

The DASISH Question Variable Data Base (QVDB)

DATA SERVICE INFRASTRUCTURE FOR THE SOCIAL SCIENCES AND HUMANITIES

QVDB (and QDDT), a selection of the requirements

- DDI - Lifecycle based storage structure for metadata elements of high level of granularity
 - multilinguality
 - study-independent components
- DDI - Lifecycle and DDI-Codebook export and import possibilities to/from tools/web-services
- Communication between the three tools should be possible; minimal human interaction
- Support boolean field level search
- Core module based on DDI components; DDI profile; Resource Packages
- Open source system
- User access rights

[illegible]

QVDB: possible use – archive processes:

Create new variables for a questionnaire module for a new ESS round

1) View source questions in the module of the current round (QS R5)
2) View comparison between question list for module in the current round and that of the former round (Comparison QS R4 and QS R5)

a) No changes in question list:

- Variable corresponding variable list and included elements
- Reuse variable list used in former round (VS R4) or update if necessary

b) Questions deleted from list:

- Delete and update corresponding variables from variable list used in former round (VS R4)

c) Questions added to list:

- Check if the question has been used earlier and if so reusable corresponding variables exist in the database.
- Reuse, update or create new variable.

d) Questions changed:

- Check earlier versions of the question and whether corresponding variables exist that could be reused.
- Reuse, update or create new variable.

A new variable could have a based-on reference to a variable it is based on

[illegible]

- The QVDB builds on the database structure of the QDDT, but the QVDB also includes variables
- The conceptual model is based on DDI-Lifecycle

The diagram illustrates the QVDB architecture, which is based on the DDI-Lifecycle. It shows a central 'QVDB' component connected to several other modules: 'Data Management', 'Metadata', 'Data Access', 'Data Storage', 'Data Processing', 'Data Distribution', 'Data Archiving', 'Data Preservation', 'Data Restoration', 'Data Migration', 'Data Integration', 'Data Interchange', 'Data Exchange', 'Data Transfer', 'Data Communication', 'Data Network', 'Data System', 'Data Environment', 'Data Infrastructure', 'Data Platform', 'Data Framework', 'Data Model', 'Data Schema', 'Data Structure', 'Data Organization', 'Data Design', 'Data Development', 'Data Deployment', 'Data Operation', 'Data Maintenance', 'Data Monitoring', 'Data Evaluation', 'Data Improvement', 'Data Optimization', 'Data Enhancement', 'Data Expansion', 'Data Growth', 'Data Evolution', 'Data Transformation', 'Data Conversion', 'Data Translation', 'Data Transmutation', 'Data Transfiguration', 'Data Transmogrification', 'Data Transmutation', 'Data Transfiguration', 'Data Transmogrification'. The diagram uses various shapes (rectangles, ovals, diamonds) and arrows to represent different types of data flows and relationships between these components.

QVDB: Relationships between variables and questions

The diagram illustrates the relationships between variables and questions across three rounds (Round 1, Round 2, Round 3) in the QVDB system. The components are organized into four rows:

- Survey**: Lists the rounds: Round 1, Round 2, Round 3.
- Variable**: Shows variables v_1 , v_2 , and v_3 (orange ovals) associated with each round. Dashed horizontal lines connect v_1 to v_2 and v_2 to v_3 .
- Source question**: Shows a large blue oval labeled v_1 for Round 1 and Round 2, and a smaller blue oval labeled v_2 for Round 3. Solid arrows point from the variables in the 'Variable' row to the source questions: v_1 to the large v_1 oval, v_2 to the large v_1 oval, and v_3 to the v_2 oval.
- Translation eng_gb**: Shows variables v_1 , v_2 , and v_3 (purple ovals) for each round. Dashed horizontal lines connect v_1 to v_2 and v_2 to v_3 . Dashed curved arrows point from the source questions in the 'Source question' row to the translation variables: from the large v_1 oval to v_1 and v_2 , and from the v_2 oval to v_3 .
- Translation ger_de**: Shows a large green oval labeled v_1 for Round 1 and Round 2, and a smaller green oval labeled v_2 for Round 3. Dashed horizontal lines connect v_1 to v_2 . Dashed curved arrows point from the source questions in the 'Source question' row to the translation variables: from the large v_1 oval to the large v_1 oval, and from the v_2 oval to the v_2 oval.

QVDB – next steps and future outlook

Same as for the QDDT:

- Further development
- Real life use by ESS and SHARE
- Real life use by other survey projects
- Interoperability with other DDI-L lifecycle based and compatible survey tools

The QVDB:

- Include functionality to support further archive business steps, most importantly data curation
- The database could serve as a repository in a possible CESSDA DDI-Lifecycle based network (CESSDA portal)

The diagram illustrates the QVDB architecture and its integration with existing systems. It shows a flow from Questionnaire design to Question catalogue, which then leads to Translation. The Translation step is linked to Other tools (e.g. data dissemination, analysis tool). The Question catalogue is also linked to the CESSDA Repository. The CESSDA Repository is part of a larger network of CESSDA entities, including CESSDA CORE, CESSDA QDR, CESSDA JCIR, and CESSDA JCIDB. A reference is provided: cessda page 09-2 (Grimpey et al 2008).
